Textile Industry

AI New Experience in Fabric Inspection

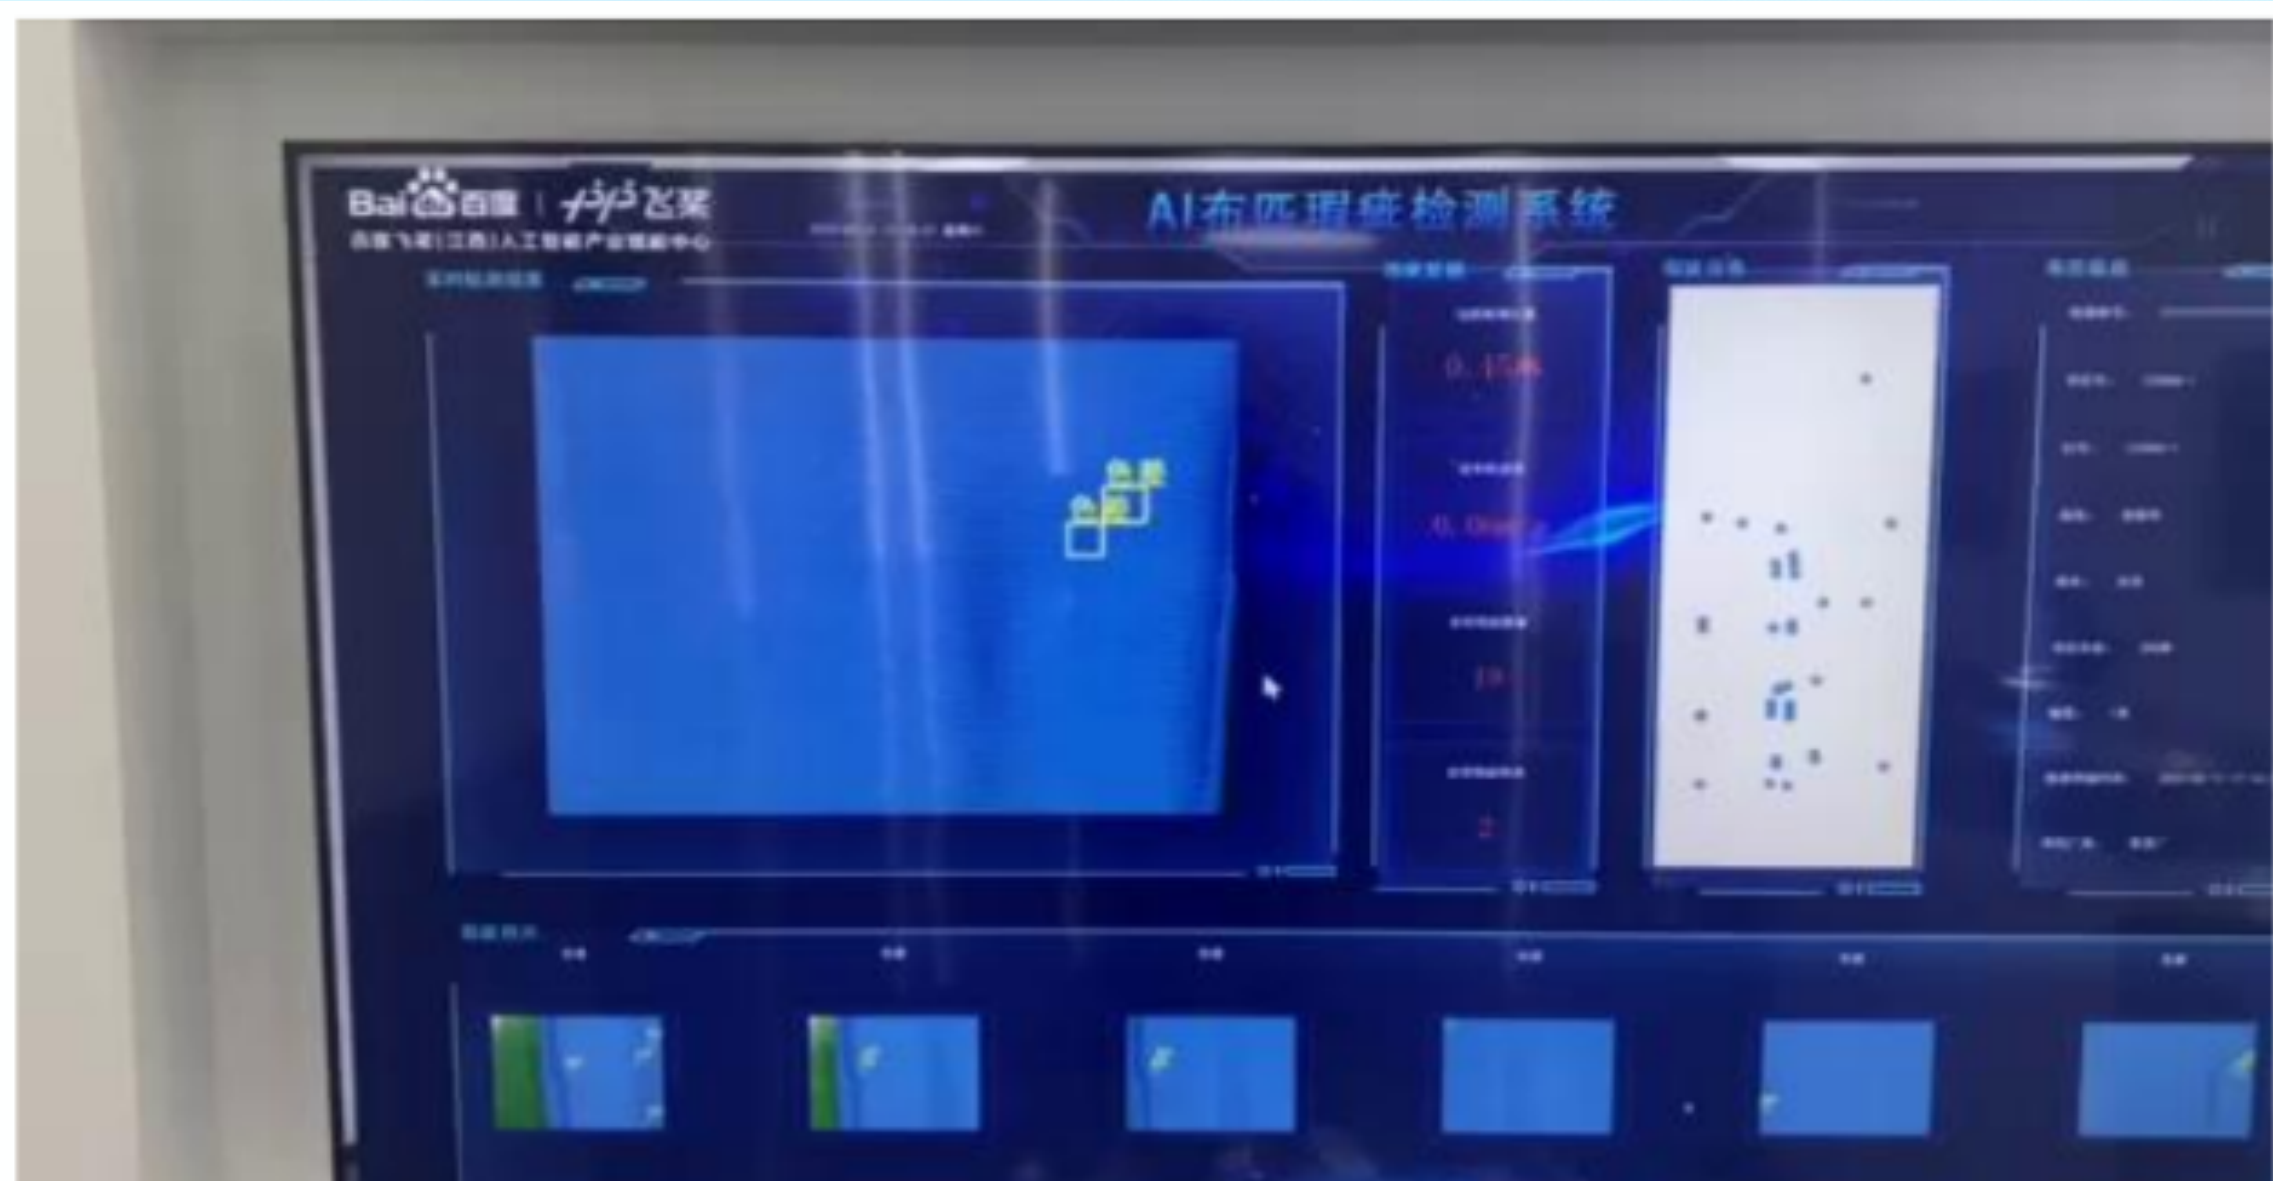

❖ **Low Efficiency:** Manual fabric inspection time is about **15** meters/minute, and repetitive tasks such as marking and recording data take more time.

Traditional reports require manual calculation and filling.

❖ **Poor Quality:** Poor detection of defects, manual inspection is prone to fatigue and subjective errors, with an average detection rate of about **70%**. ;

❖ **High Cost:** High recruitment, management, and training costs. Information recognized by humans cannot be effectively transmitted, and the industry faces pain points such as forming unified standards.

幅宽检测

- 1.系统精确显示幅宽偏差数据和地图，提供决策依据；
- 2.降低用工成本（减人），提高检测效率，不受客观因素影响；
- 3.减少布料浪费，降低采购成本。

成衣尺寸检测

- 1.提高检测精度和效率（由分钟缩短到秒）
- 2.在熨烫后直接进行检测，由抽检实现全检，保障出厂的每件衣服都合格满足高端用户订单需求！提高品牌的知名度！

This solution is widely applicable to fabric quality inspection at various stages of textile industry manufacturing, printing and dyeing, garment making, etc., and is suitable for inspection of surface defects and color differences of knitted and woven plain fabrics. More accurate, faster inspection efficiency, and lower inspection costs make intelligent fabric inspection the best choice for the future textile industry.

- ❖ **Image Acquisition Module** collects image data of fabrics, including color, texture, shape, etc
- ❖ **Image Processing Module** preprocesses the collected images, including detail enhancement, noise removal, contrast adjustment, etc.
- ❖ **Intelligent Decision-Making Module** comprehensively judges the quality and qualification of fabrics based on factors such as fabric material, color, size, and historical inspection data, and generates inspection reports that meet requirements.

2

Agriculture

Yingde Red Tea Withering Process Practice

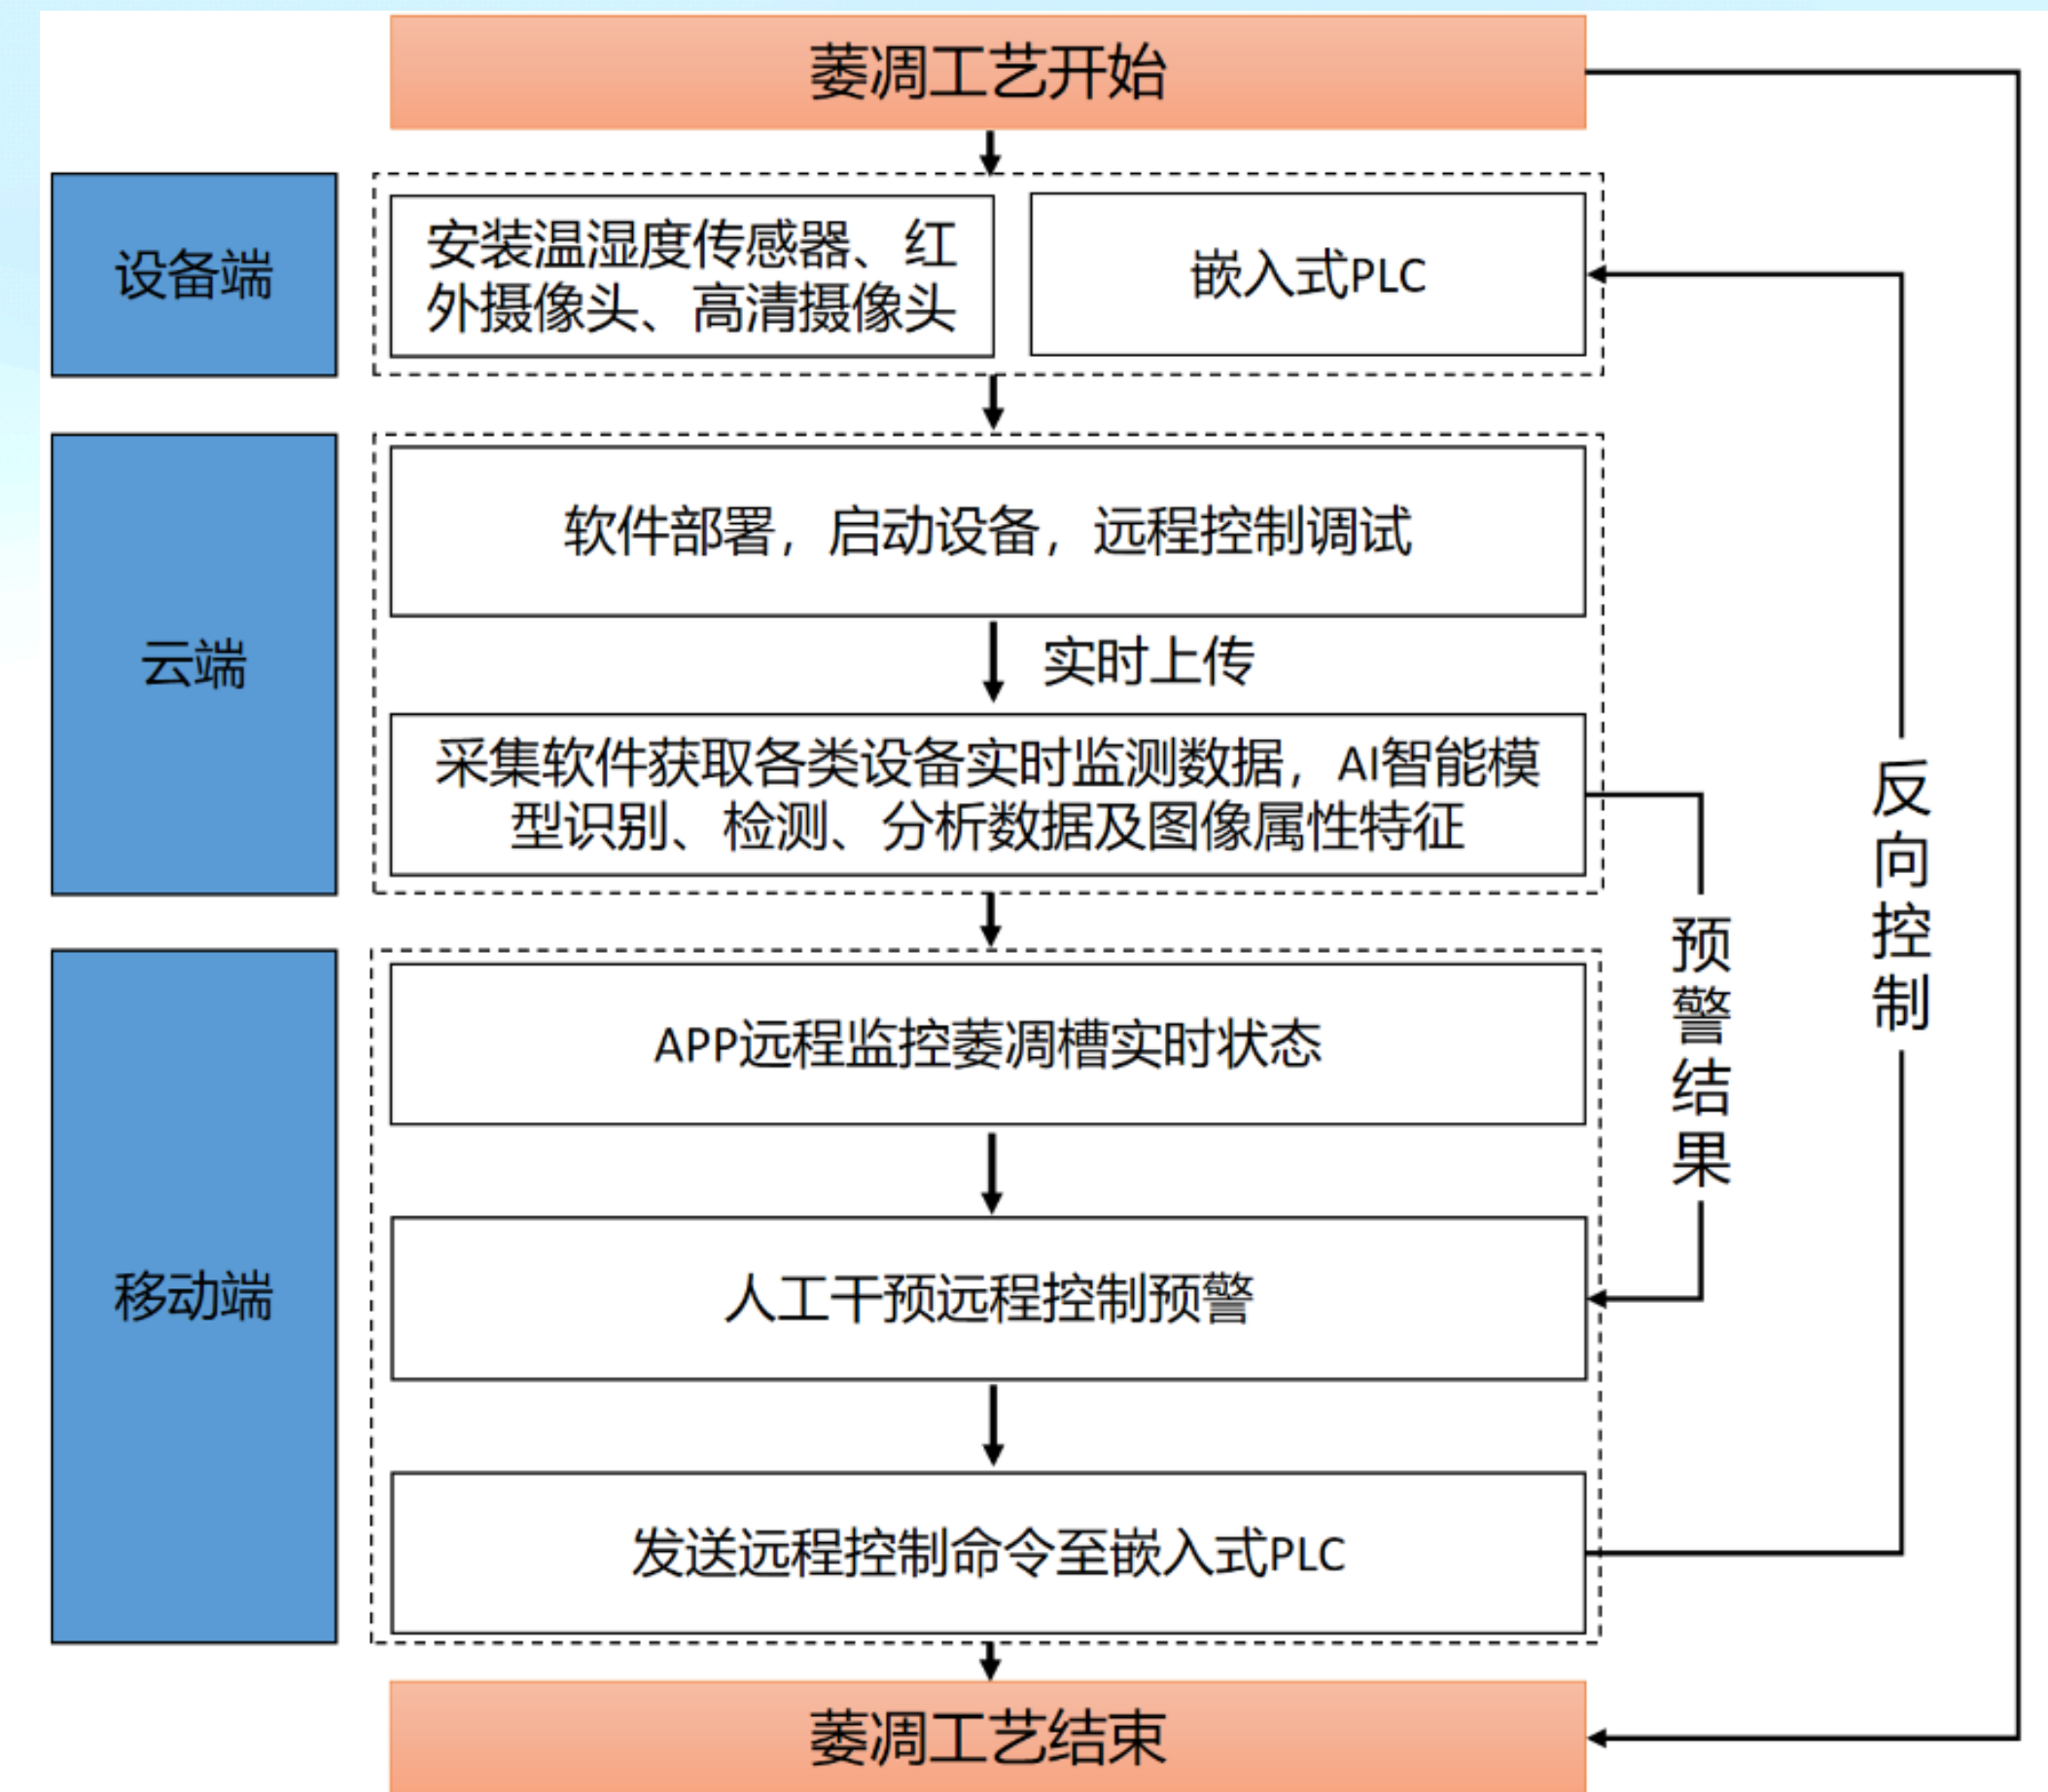

Guangdong Hongyan Tea Industry Co., Ltd. is an important enterprise in the Yingde red tea industry and a technology transformation platform of the Tea Research Institute of Guangdong Academy of Agricultural Sciences. By relying on technological advantages, it is committed to R&D and production, representing the highest level of specialty famous tea products in Guangdong.

However, Hongyan Tea also faces industry **pain points such as tight labor in tea gardens, inconsistent picking standards for fresh leaves, uneven withering standards for red tea, and contradictions between product standards and tea garden production.**

Withering is an important process for forming the quality of black tea. Currently, in traditional withering processes, fresh leaves are spread on withering troughs, and production personnel control the air volume and time of the withering trough blower to wither the fresh leaves. Since different tea makers have different judgments on the activity of withering, it directly affects the quality of each batch of tea leaves.

By combining infrared thermal imaging technology, AI intelligent recognition models, and high-definition camera monitoring technology to form intelligent withering equipment, it is applied to tea withering. The blower's start and stop state and air volume size are automatically controlled based on the changes of various factors in the withering process of fresh leaves, accurately mastering the withering standards of tea leaves.

"Smart Tea Processing" is one of the key research and implementation objects in the future tea industry. Therefore, the establishment and application of intelligent withering equipment have great prospects. Moreover, by establishing models for the standard state of appropriate withering of tea leaves, it can more accurately determine the real-time state of fresh leaf withering. Additionally, the withering equipment can automatically control the blower's start and stop state based on the water content and physical state of the fresh leaves, truly realizing "fully intelligent withering of fresh leaves."

利益行业发展

- 减轻传统茶叶萎凋带来的巨大的劳动损耗与生产成本
- 消除茶叶品质参差不齐的现象
- 茶叶品质趋于标准化生产

科技创新推广

- 中小型茶叶加工企业至少节约生产成本10—20万元/年
- 增创收益约20-30万元/年
- 培养“智慧茶叶加工”技能型人才至少20人次/年

3

Animal Husbandry

Intelligent "ID Card" for Dairy Cows

The client focuses on movable property pledge supervision business, specializing in movable property pledge supervision business, dedicated to providing enterprises with convenient, high-quality, safe, and efficient supervision services. Currently, ranch supervision mainly relies on traditional human monitoring, supplemented by conventional supervision systems, still requiring manual counting and completion of statistical reports.

- ❖ Automated Image Quality Screening
- ❖ Create a Visual Monitoring Platform
- ❖ Static Counting Function
- ❖ Dynamic Tracking Function

摄像机采集现场视频图像数据

抽帧主机抽取图片到办公机房的边缘盒子训练开发模型

部署系统AI模型自动筛选合格图片

系统根据AI模型图片自动点数（静态、进出）

系统生成牧场当日监管等各类数据表

各金融机构通过PC/移动端查看牧场监管实时数据

Urban Management

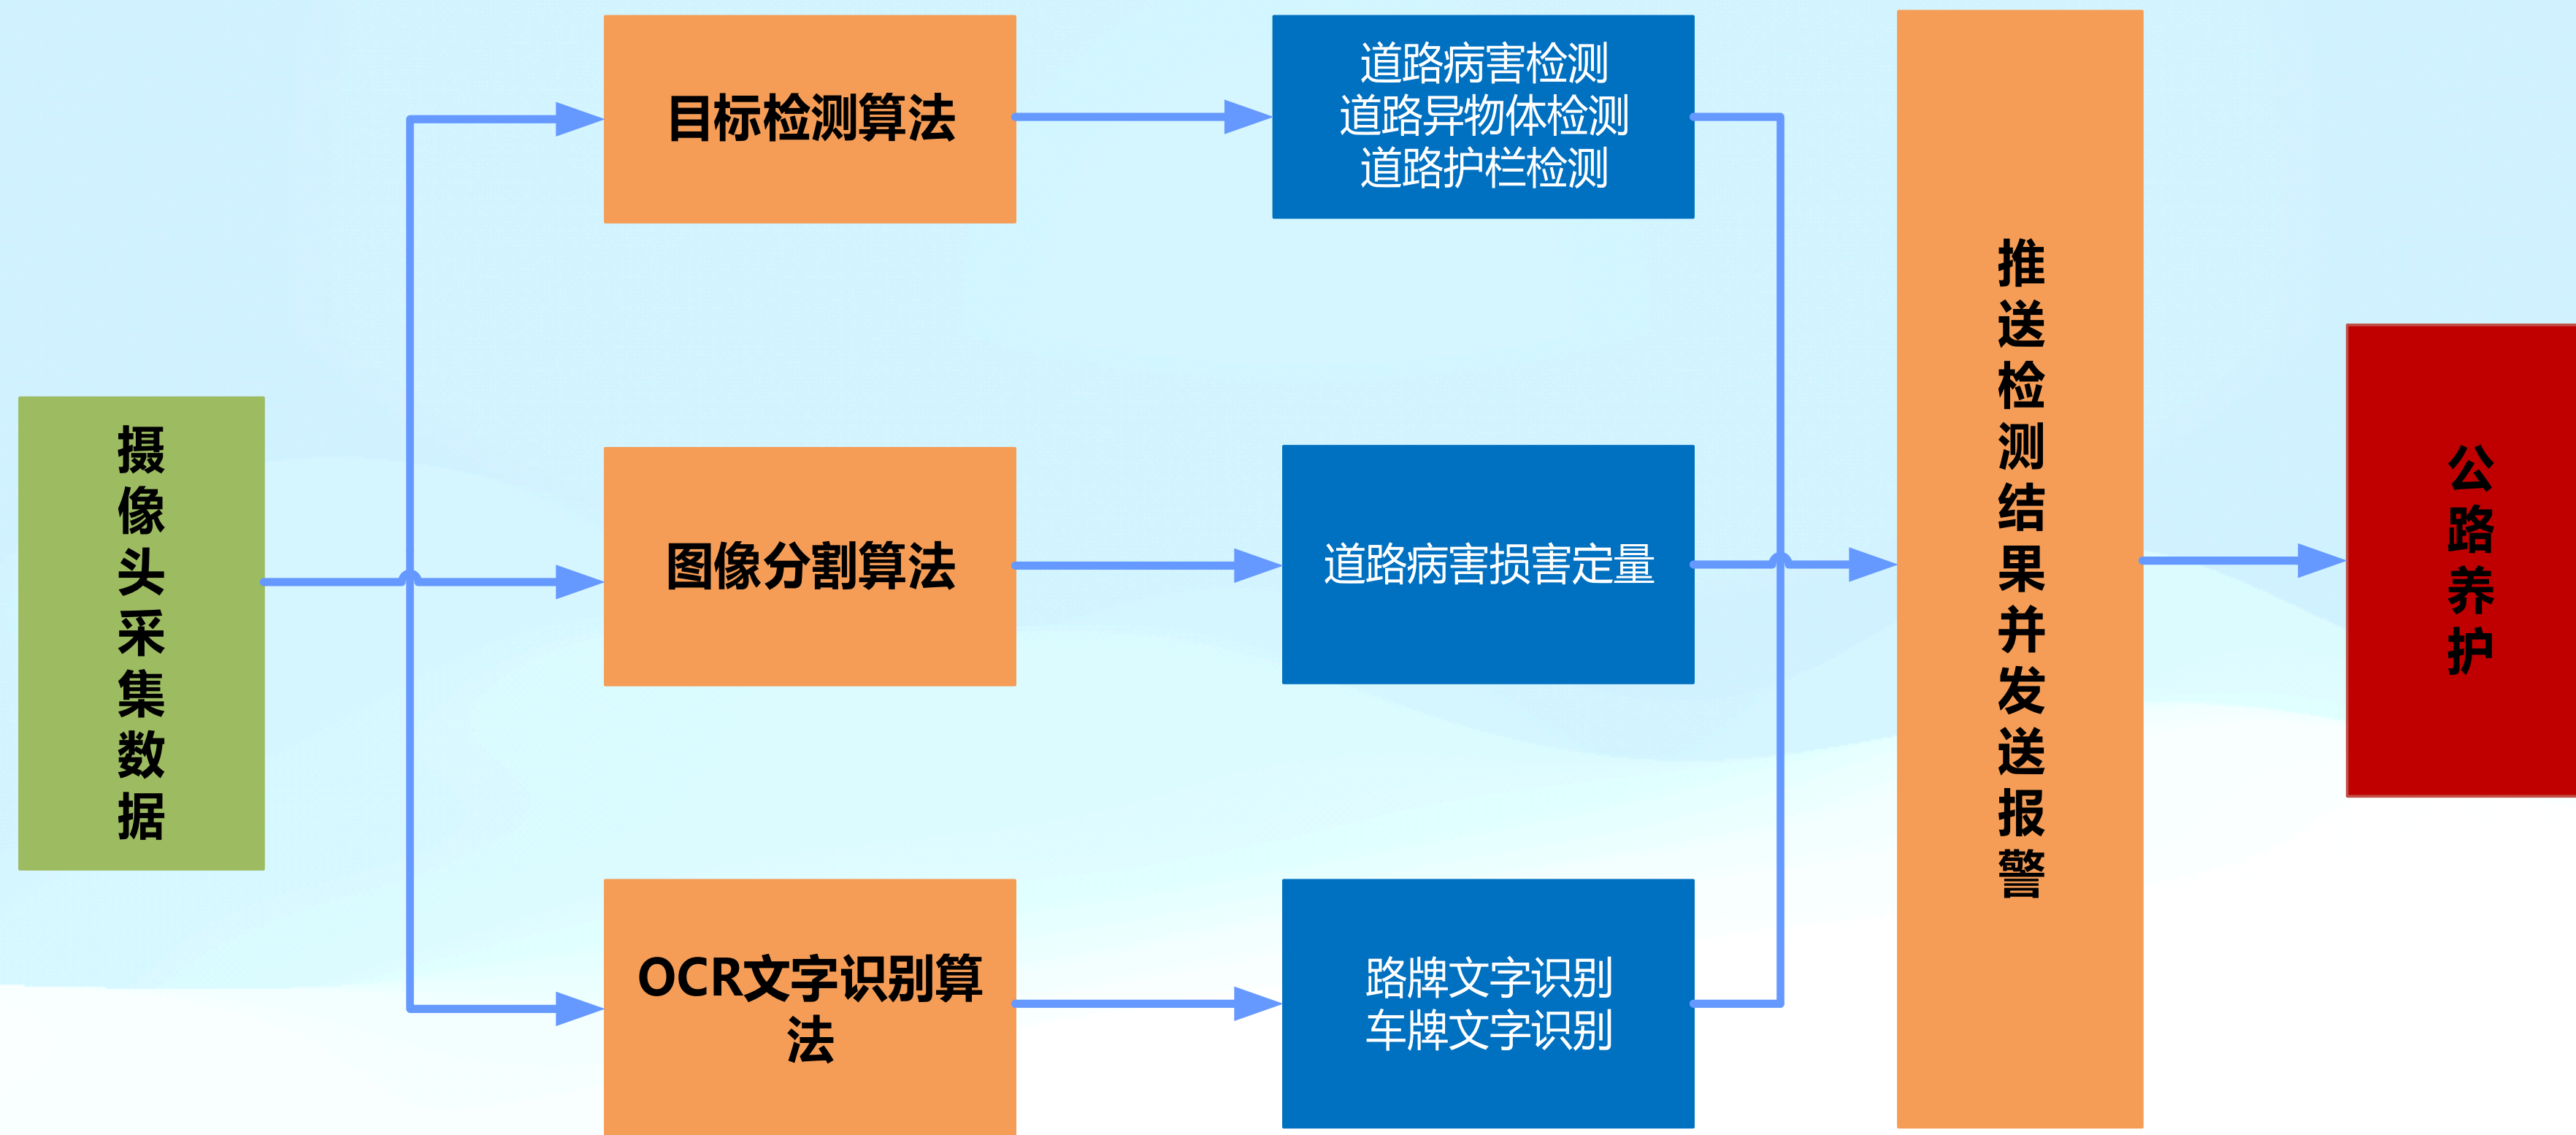

All-weather Road Defect Inspection

China's road construction has developed rapidly in recent years, with an unprecedented growth rate. However, due to the rapid increase in the number of motor vehicles, the damage speed of road surfaces is also accelerating, and the workload of road disease detection is becoming increasingly heavy. Currently, the manual visual inspection method adopted has low efficiency and consumes a lot of time, manpower, and material resources.

According to statistics, a single highway road disease screening requires visual inspection of over **40 million photos**, and the engineer team needs to spend at least a few months to complete the work.

Based on these pain points, Baidu Artificial Intelligence Industry Empowerment Center has designed a complete set of road monitoring solutions based on computer vision.
